

Incident report analysis

Instructions

As you continue through this course, you may use this template to record your findings after completing an activity or to take notes on what you've learned about a specific tool or concept. You can also use this chart as a way to practice applying the NIST framework to different situations you encounter.

Summary	It was recently reported to the IT department that the network services had been disrupted and none of the network resources could be utilised. The company focuses on web and graphic design and social media solutions, therefore all communication using social platforms, web and graphic design services were all impacted by the disruption. It is believed that this sudden loss of access to service was due to incoming flood of ICMP packets which was most likely the act of a cybersecurity attack from a threat actor. We had our incident management team launch an investigation into the identification of the threat
Identify	The security team utilized network analyzer tools and TCP dump log files to identify what the potential threat was. It was determined that the increased amount of ICMP packets being sent to the network was the result of a malicious actor conducting an ICMP flood attack to overwhelm and cripple the network. The breach was determined to come through due to the company having an unconfigured firewall that wasn't able to detect any suspicious activity which resulted in the DDoS attack.
Protect	To protect the network from future attacks of this nature the team implemented new firewall rules to limit the rate of incoming ICMP packets so

	the system doesn't get overwhelmed by requests. Source IP address verification on the firewall to reduce the impact of spoof IP addresses on incoming ICMP packets. Lastly utilizing Intrusion Protection Systems (IPS) to filter out and block any traffic that has a known signature of suspicious activity
Detect	For the detection of potential threats, the team implemented the use of network monitoring software and SIEM tools to identify and report any significant events occurring within the network. Additionally we have implemented Intrusion Detection Systems (IDS) to monitor and notify of any known signatures that are deemed to be threats
Respond	The response from the team was to block the incoming ICMP packets and stop all non critical network services. For future incidents the team will isolate affected systems to prevent further disruptions. The team will analyze logs to check for suspicious and abnormal activity
Recover	The team's last task was to restore the network to its baseline function. The team was able to use a backup which contained previously unaffected data to reboot the system to a functioning state

Reflections/Notes:
